

Homework 5

1a)

$$P(\text{Pass} \mid \text{Smart}, \text{Study}) = \frac{P(\text{Smart}, \text{Study}, \text{Pass})}{P(\text{Smart}, \text{Study})}$$

$$P(\text{Pass} \mid \text{Smart}, \text{Study}) \times P(\text{Smart}, \text{Study}) = P(\text{Smart}, \text{Study}, \text{Pass})$$

Because Smart and Study are independent:

$$P(\text{Pass} \mid \text{Smart}, \text{Study}) \times P(\text{Smart}) \times P(\text{Study}) = P(\text{Smart}, \text{Study}, \text{Pass})$$

1b)

	pass		$\neg$ pass	
	$\neg$ smart	smart	$\neg$ smart	smart
$\neg$ study	0.084	0.126	0.336	0.054
study	0.168	0.114	0.112	0.006

1c)

$$P(\text{smart} \mid \text{pass}, \neg \text{study}) = P(\text{smart}, \text{pass}, \neg \text{study}) / P(\text{pass}, \neg \text{study}) = 0.126 / (0.084 + 0.126) = 0.6$$

1d)

$$P(\neg \text{study} \mid \text{smart}, \neg \text{pass}) = P(\neg \text{study}, \text{smart}, \neg \text{pass}) / P(\text{smart}, \neg \text{pass}) = 0.054 / (0.054 + 0.006) = 0.9$$

1e)

$$P(\text{pass} \mid \text{smart}) = P(\text{pass}, \text{smart}) / P(\text{smart})$$

$$= (P(\text{pass}, \text{smart}, \neg \text{study}) + P(\text{pass}, \text{smart}, \text{study})) / P(\text{smart})$$

$$= (0.126 + 0.114) / (0.3)$$

$$= 0.8$$

1f)

$$P(\text{pass}|\text{study}) = P(\text{pass, study}) / P(\text{study})$$

$$= (P(\text{pass, study, smart}) + P(\text{pass, study, -smart})) / P(\text{study})$$

$$= (0.168 + 0.114) / 0.4$$

$$= 0.705$$

2a)

$P(\text{Cold}, \text{Sneeze}, \text{Allergic}, \text{Scratches}, \text{Cat}) =$

$P(\text{Cold})P(\text{Sneeze}|\text{Cold} \wedge \text{Allergic})P(\text{Allergic}|\text{Cat})P(\text{Scratches}|\text{Cat})P(\text{Cat})$

2b)

$P(\text{-cold}, \text{sneeze}, \text{allergic}, \text{scratches}, \text{cat}) =$

$P(\text{-cold})P(\text{sneeze}|\text{-cold} \wedge \text{allergic})P(\text{allergic}|\text{cat})P(\text{scratches}|\text{cat})P(\text{cat}) =$

$0.95 \times 0.7 \times 0.75 \times 0.5 \times 0.02 = 0.0049875$

2c)

$P(\text{cat}|\text{-cold}, \text{sneeze}, \text{allergic}, \text{scratches}) =$

$P(\text{cat}, \text{-cold}, \text{sneeze}, \text{allergic}, \text{scratches}) / (P(\text{cat}, \text{-cold}, \text{sneeze}, \text{allergic}, \text{scratches}) + P(\text{-cat}, \text{-cold}, \text{sneeze}, \text{allergic}, \text{scratches}))$

$P(\text{cat}, \text{-cold}, \text{sneeze}, \text{allergic}, \text{scratches}) =$

$P(\text{-cold})P(\text{sneeze}|\text{-cold} \wedge \text{allergic})P(\text{allergic}|\text{cat})P(\text{scratches}|\text{cat})P(\text{cat}) =$

$0.95 \times 0.7 \times 0.75 \times 0.5 \times 0.02 = 0.0049875$

$P(\text{-cat}, \text{-cold}, \text{sneeze}, \text{allergic}, \text{scratches}) =$

$P(\text{-cold})P(\text{sneeze}|\text{-cold} \wedge \text{allergic})P(\text{allergic}|\text{-cat})P(\text{scratches}|\text{-cat})P(\text{-cat}) =$

$0.95 \times 0.7 \times 0.05 \times 0.05 \times 0.98 = 0.00162925$

$0.0049875 / (0.0049875 + 0.00162925) = 0.75376884422$

2d)

$P(\text{cat}|\text{scratches}) = (P(\text{scratches}|\text{cat})P(\text{cat})) / P(\text{scratches})$

Numerator: $P(\text{scratches}|\text{cat}) * P(\text{cat}) = 0.5 \times 0.02 = 0.01$

2e)

Denominator: $P(\text{scratches}) =$

$P(\text{scratches} \wedge \text{cat}) + P(\text{scratches} \wedge \neg \text{cat}) =$

$P(\text{scratches}|\text{cat})P(\text{cat}) + P(\text{scratches} \wedge \neg \text{cat})P(\neg \text{cat})$

$= (0.5 \times 0.02) + (0.05 \times 0.98)$

Requires 4 joint probabilities from the JPT.

3a)

To start a car, you have to be at the car and have the key, and the car has to have a charged battery and the tank has to have gas. Afterwards, the car will be running, and you will still be at the car and have the key after starting the engine.

Action (startCar(x, y, z, a, b))

//Have(x,y) means x has y

Precond: $\text{operator}(x) \wedge \text{car}(y) \wedge \text{key}(z) \wedge \text{battery}(a) \wedge \text{tank}(b) \wedge \text{At}(x, y) \wedge \text{Have}(x, z) \wedge \text{Have}(y, a) \wedge \text{charged}(x, a) \wedge \text{hasGas}(y, b)$

Effect: $\text{running}(y) \wedge \text{At}(x, y) \wedge \text{Have}(x, z)$

3b)

$\forall x, y, z, a, b, s \text{ operator}(x, s) \wedge \text{car}(y, s) \wedge \text{key}(z, s) \wedge \text{battery}(a, s) \wedge \text{tank}(b, s) \wedge \text{At}(x, y, s) \wedge \text{Have}(x, z, s) \wedge \text{Have}(y, a, s) \wedge \text{charged}(x, a, s) \wedge \text{hasGas}(x, b, s) \rightarrow \text{running}(y, \text{do}(\text{startCar}(x, y, z, a, b), s)) \wedge \text{At}(x, y, \text{do}(\text{startCar}(x, y, z, a, b), s)) \wedge \text{Have}(x, z, \text{do}(\text{startCar}(x, y, z, a, b), s))$

3c) *starting this car will not changes whether any other car is out of gas (tank empty)*

$\forall x, y, z, a, b, s, c, d \text{ operator}(x, s) \wedge \text{car}(y, s) \wedge \text{key}(z, s) \wedge \text{battery}(a, s) \wedge \text{tank}(b, s) \wedge \text{At}(x, y, s) \wedge \text{Have}(x, z, s) \wedge \text{Have}(y, a, s) \wedge \text{charged}(x, a, s) \wedge \text{hasGas}(x, b, s) \wedge \text{car}(c) \wedge \text{tank}(d) \wedge c \neq y \wedge d \neq b \rightarrow [\text{hasGas}(c, d, s) \leftrightarrow \text{hasGas}(c, d, \text{do}(\text{startCar}(x, y, z, a, b), s))]$
